The 72nd Report on

FOOD PRODUCTS
1967

J. Gordon Hanna

This report is a summary of the examinations of official samples of foods, drugs and cosmetics submitted by the Commissioner of Consumer Protection and the Commissioner of Agriculture during the calendar year 1967.

The bulletin contains an alphabetical listing of Connecticut towns with dealers from which samples were collected grouped according to the various towns. The intent of this arrangement is to make information readily available to aid the consumer in judging the reliabilities of the dealers in his area.

In addition to the samples listed, the Commissioner of Agriculture submitted 365 official samples of the Connecticut milk supply for chlorinated pesticide residue analyses. Of this number, 3 samples contained DDT and 1 contained dieldrin, both pesticides in low but significant amounts.

Analyses for adulteration or for conformance to label claims were in many cases the bases for deciding whether or not samples were deficient. In other cases examinations of certain products for conformance to State and Federal definitions and standards of identity were used. Some of these latter requirements may be of interest relative to the interpretation of the data listed in this bulletin.

Frankforts and bologna are limited to not over 3.5 per cent fillers, 10 per cent water, and 200 parts per million sodium nitrite. Hamburg is required to contain not more than 30 per cent fat and pork sausage may not contain more than 50 per cent fat. The addition of sulfur dioxide to any meat product is not permitted.

Vitamin D milk is standardized to contain 400 USP units of vitamin D per quart. Vitamin mineral fortified milk is required to contain not less than the following quantities of vitamins: vitamin A, 4,000 and vitamin D, 400 USP units per quart; thiamine, 1; riboflavin, 2; and niacin, 10 milligrams per quart.

Federal regulations require jellies, jams, and other fruit preserves to contain not less than 45 parts of fruit to each 55 parts of added sugar; their soluble solids contents must not be less than 68% (65% in the case of jellies and apricot, peach, pear, plum and a few other fruit jams.)

The work represented by this report was performed by Messrs. Botsford, Hankin and staff, Keirstead, Squires, West, Wickroski, Miss Hornig and Mrs. McLean. The responsibility for obtaining samples and for taking any legal action resulting from the laboratory findings rested with Commissioner Gill of the Department of Agriculture and Commissioner Casey of the Department of Consumer Protection.

PESTICIDE RESIDUES

Evaluations of the significance of the pesticide residues found in milk and other food and reported in this bulletin are based on official tolerance levels established by the Food and Drug Administration, U. S. Department of Health, Education and Welfare. In most cases these tolerance levels include a 100-fold safety factor based on the physiological effects on test animals.

Concern is often expressed if any pesticide residues at all are detected in food. It should be kept in mind that modern analytical instruments have capabilities to detect extremely minute amounts. In fact the units in which residue findings are expressed are so small as to make it difficult to form a meaningful concept. Residues in many cases are routinely detectable down to at least the 10 parts per billion level. This is roughly comparable to looking for one particular set of twins in the entire population of the United States.
